

# Tensors, layers and autoencoders

INTRODUCTION TO DEEP LEARNING WITH KERAS

**Miguel Esteban**

Data Scientist & Founder

# Accessing Keras layers

```
# Accessing the first layer of a Keras model  
first_layer = model.layers[0]  
# Printing the layer, and its input, output and weights  
print(first_layer.input)  
print(first_layer.output)  
print(first_layer.weights)
```

```
<tf.Tensor 'dense_1_input:0' shape=(?, 3) dtype=float32>
```

```
<tf.Tensor 'dense_1/Relu:0' shape=(?, 2) dtype=float32>
```

```
[<tf.Variable 'dense_1/kernel:0' shape=(3, 2) dtype=float32_ref>,  
<tf.Variable 'dense_1/bias:0' shape=(2,) dtype=float32_ref>]
```

# What are tensors?

```
# Defining a rank 2 tensor (2 dimensions)
T2 = [[1,2,3],
      [4,5,6],
      [7,8,9]]

# Defining a rank 3 tensor (3 dimensions)
T3 = [[1,2,3],
      [4,5,6],
      [7,8,9],  
  
      [10,11,12],
      [13,14,15],
      [16,17,18],  
  
      [19,20,21],
      [22,23,24],
      [25,26,27]]
```

```
# Import Keras backend  
import tensorflow.keras.backend as K  
  
# Get the input and output tensors of a model layer  
inp = model.layers[0].input  
out = model.layers[0].output  
  
# Function that maps layer inputs to outputs  
inp_to_out = K.function([inp], [out])  
  
# We pass an input and get the output we'd get in that first layer  
print(inp_to_out([X_train]))
```

```
# Outputs of the first layer per sample in X_train  
[array([[0.7, 0], ..., [0.1, 0.3]])]
```

it's time to introduce a new architecture...

# Autoencoders!

INPUTS == OUTPUTS

# Autoencoders!

# Autoencoder use cases

- Dimensionality reduction:
  - Smaller dimensional space representation of our inputs.
- De-noising data:
  - If trained with clean data, irrelevant noise will be filtered out during reconstruction.
- Anomaly detection:
  - A poor reconstruction will result when the model is fed with unseen inputs.
- ...

# Building a simple autoencoder

```
# Instantiate a sequential model
autoencoder = Sequential()
# Add a hidden layer of 4 neurons and an input layer of 100
autoencoder.add(Dense(4, input_shape=(100,), activation='relu'))
# Add an output layer of 100 neurons
autoencoder.add(Dense(100, activation='sigmoid'))
# Compile your model with the appropriate loss
autoencoder.compile(optimizer='adam', loss='binary_crossentropy')
```

# Breaking it into an encoder

```
# Building a separate model to encode inputs
encoder = Sequential()
encoder.add(autoencoder.layers[0])
# Predicting returns the four hidden layer neuron outputs
encoder.predict(X_test)
```

```
# Four numbers for each observation in X_test
array([10.0234375, 5.833543, 18.90444, 9.20348],...)
```

# What are RNNs?

They learn what to ignore, what to keep  
and to select the most important pieces  
of past information.

# When to use LSTMs?

- Image captioning
- Speech to text
- Text translation
- Document summarization
- Text generation
- Musical composition
- ...

"man in black shirt is playing guitar."

"construction worker in orange safety vest is working on road."

<sup>1</sup> Karpathy, A., & Fei-Fei, L. (2015). Deep visual-semantic alignments for generating image descriptions.

+ Text

this is a sentence

42 11 23 1

```
text = 'Hi this is a small sentence'

# We choose a sequence length
seq_len = 3

# Split text into a list of words
words = text.split()
```

```
['Hi', 'this', 'is', 'a', 'small', 'sentence']
```

```
# Make lines
lines = []
for i in range(seq_len, len(words) + 1):
    line = ' '.join(words[i-seq_len:i])
    lines.append(line)
```

```
['Hi this is', 'this is a', 'is a small', 'a small sentence']
```

```
# Import Tokenizer from keras preprocessing text
from tensorflow.keras.preprocessing.text import Tokenizer
# Instantiate Tokenizer
tokenizer = Tokenizer()
# Fit it on the previous lines
tokenizer.fit_on_texts(lines)
# Turn the lines into numeric sequences
sequences = tokenizer.texts_to_sequences(lines)
```

```
array([[5, 3, 1], [3, 1, 2], [1, 2, 4], [2, 4, 6]])
```

```
print(tokenizer.index_word)
```

```
{1: 'is', 2: 'a', 3: 'this', 4: 'small', 5: 'hi', 6: 'sentence'}
```

```
# Import Dense, LSTM and Embedding layers
from tensorflow.keras.layers import Dense, LSTM, Embedding
model = Sequential()
# Vocabulary size
vocab_size = len(tokenizer.index_word) + 1
# Starting with an embedding layer
model.add(Embedding(input_dim=vocab_size, output_dim=8, input_length=2))
# Adding an LSTM layer
model.add(LSTM(8))

# Adding a Dense hidden layer
model.add(Dense(8, activation='relu'))
# Adding an output layer with softmax
model.add(Dense(vocab_size, activation='softmax'))
```

# **Let's do it!**

**INTRODUCTION TO DEEP LEARNING WITH KERAS**

# You're done!

INTRODUCTION TO DEEP LEARNING WITH KERAS

**Miguel Esteban**

Data Scientist & Founder

# Congratulations!

# You've learned a lot

# What you've learned

- The basics of neural networks
- Building sequential models
- Building models for regression
- Approaching binary classification, multi-class and multi-label problems with neural networks
- Activation functions
- Hyperparameter tuning
- Autoencoders
- De-noising images
- CNN concepts
- Use pre-trained models
- Visualize convolutions
- LSTMs concepts
- Work with embedding layers and text
- All of this by using many different datasets and learning plenty of Keras's utility functions.

# What could you learn next?

- Go deeper into CNNs
- Go deeper into LSTMs
- Keras Functional API
- Models that share layers, models with several branches
- GANs: Generative Adversarial Networks
- Deeplearning projects

It's sad to say goodbye  
my friend

# **Have a good one!**

**INTRODUCTION TO DEEP LEARNING WITH KERAS**
